High-speed Fiber Stretcher

Relative SM Fiber Stretch
at max. drive (P-P) in nm

The **OPTIPHASE PZ1** is the high-speed member of our family of fiber stretchers. It is a fiber wound piezoelectric element for use in a wide range of optical interferometric measurement and sensing system applications. Typical uses include open loop demodulation, sensor simulation, variable optical delay, general purpose fiber interferometry and large angle modulation of interferometric phase.

Optiphase's expertise in the design, manufacture and use of all-fiber interferometers has produced a unique multi-layer winding approach resulting in an enhanced modulation function while maintaining a

high operational frequency [see charts]. PZ1 Fiber Stretchers are available with SM, commercial PM [PANDA or Bowtie] or RC [SM Reduced Cladding] fiber types.

The PZ1 delivers a high performance to cost ratio, exceeding all other known competitive devices. The compact and low-profile form factor makes the PZ1 easily configurable into small spaces. In addition, our fiber stretchers are unique in that they do not require proprietary drivers. For most low voltage applications ($< \pm 15V$) our stretchers can be driven by standard electronics such as signal generators, op-amps or other laboratory equipment without modification. For more information on how to drive PZ1 stretchers see page 2.

FEATURES & BENEFITS

- High Speed
- Low Cost
- Compact package
- SM, PM or RC fiber
- Multiple termination choices
- Unique multi-layer winding
- Can be driven with general purpose electronics

The PZ1's low profile and small footprint makes it easy to integrate into virtually any system device. Several termination options are available, making set-up and use quick and easy.

Designed for Bipolar Drive

Optiphase fiber stretchers are designed to operate with a bipolar voltage drive. This is unique capability offers significantly greater convenience when compared to other approaches that mandate unipolar operation only with an offset voltage drive.

How to drive PZ1 stretchers

The equivalent circuit for the PZ1 fiber stretcher is shown below. At frequencies sufficiently below the first resonance (dc – 40 KHz) the effective impedance is capacitive, defined by $C0+C1+C2$, being approximately 2 nF. At 40 KHz, the magnitude of the impedance of this capacitance is 2000 ohms. Most laboratory equipment or circuitry can be used to drive this load with no modifications.

PZ1 Series Equivalent Impedance

DC - 10 KHz is approx $C0 + C1 + C2$ ($= 2 \text{ nF}$)
 First Resonance (57 KHz) defined by R1, C1, L1
 Second Resonance (140 KHz) defined by R2, C2, L2
